dispersed therein, external electrodes being provided on said block; and

a plurality of spirally wound coils buried in said block, end portions of each of the plurality of coils being electrically connected to said external electrodes; wherein

the plurality of coils are arranged such that axes of all of the plurality of coils extend substantially parallel to one another; and

at least one of said plurality of coils has a different electrical characteristic produced by at least one of (1) a different number of windings of said at least one of said plurality of coils from that of the remainder of said plurality of coils, (2) a different thickness of said at least one of said plurality of coils from that of the remainder of said plurality of coils, (3) a different diameter of said at least one of said plurality of coils from that of the remainder of said plurality of coils, and (4) a different space between wound sections of said at least one of said plurality of coils from that of the remainder of said plurality of coils.
